

Accumulator solar container mathematical model

Overview

The paper presents uses of the Equivalent Thermal Network Method to formulate a mathematical model suitable for solar domestic hot water (SDHW) system analysis. The main concept of investigation is to optimise the stratified regime of thermal accumulation and constructive parameters of heat exchange equipment (heat serpentine in tank). To improve the stability of liquid supply and solve the problems of pressure, flow pulsation, and hydraulic impact, this study established the mathematical model in the working process of an accumulator from the perspective of the accumulator station, with the liquid supply system of a fully.
