

Chemical phase change solar container and sensible heat solar container

Overview

The study addresses the comparative analysis of phase-change materials (PCMs) and sensible heat storage in solar heating systems. By developing a new model that incorporates factors such as heat losses, axial and radial conduction, and local temperature differences, the research evaluates the. Phase-change thermal batteries for renewable energy storage and waste heat recovery demand high energy density and fast charging¹⁻⁵, which are mutually exclusive because phase-change materials (PCMs) with high melting enthalpy are usually poor heat conductors⁶⁻⁸.
