

Common solar container technologies include environmentally friendly energy thermal storage

Overview

Several sensible thermal energy storage technologies have been tested and implemented since 1985. These include the two-tank direct system, two-tank indirect system, and single-tank thermocline system. In a concentrating solar power (CSP) system, the sun's rays are reflected onto a receiver, which creates heat that is used to generate electricity that can be used immediately or stored for later use. They significantly contribute to overall solar capacity and energy supply within renewable energy systems.
