

Concrete solar container principle

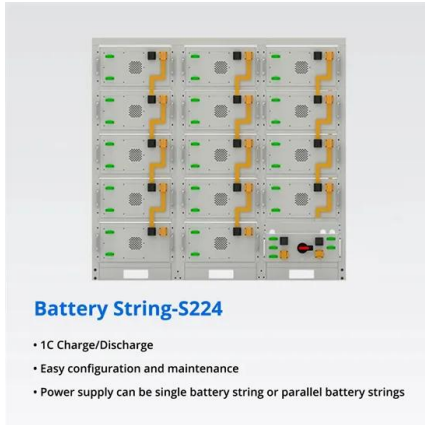

Overview

A concrete solar collector is built up from concrete absorber with a black surface coating and an integral duct system, together with a glazed cover and a wooden case. The proposed work is concerned with the experimental setup of a cheaper and economical 2m X 1m solar concrete collector and. Unlike the solar water heaters, this model involves the use of a concrete slab with copper pipes running in it for transferring heat to the water efficiently. Systems using single phase heat transfer fluids like thermal oil, pressurized water, air or superheated steam, demand storage systems for sensible heat. Direct steam generation (DSG) solar power systems eliminate synthetic oils and molten salts in the solar field and enable efficient heat collection.

CONCRETE SOLAR COLLECTOR

This solar concrete collector will help reduce the average cost of water heating by more than 50% as compared to other water heating devices. This experimental model can be used as an independent ...

Energy-harvesting concrete for smart and sustainable infrastructures

Energy-harvesting concrete has inherent compatibility with and identical lifespan to concrete infrastructures due to its cement-based property. In addition, the presence of functional ...

Solar Dryer

In direct solar dryers, the substance that is to be dehydrated is exposed to the sunlight in a vast field. Indirect solar dryers consist of an insulated box coated inside with a black absorption surface, an air ...

Parametric Analysis of Concrete Solar Collectors

A literature review of concrete solar collectors is conducted in order to define the benchmark parameters from which individual parameters are then compared. The numerical model ...
