

# English abbreviation of solar container liquid cooling plate

## Overview

---

A Liquid Cold Plate (LCP) is responsible for efficiently transferring heat from surfaces with high heat loads to the fluid used within a liquid cooling system. The performance of the liquid cold plate is critical in defining the overall effectiveness of a liquid system. On the other hand, traditional heatsinks are typically made of metal, such as aluminum or copper, and rely on conduction. They are widely used in various applications, including electronics, data centers, electric vehicles, and ESS. In this requirements document, it is assumed that material compatibility is a key factor to investigate their.
