

# Gravity compressed air and hydrogen solar container

## Overview

---

Researchers from the Korea Institute of Machinery and Materials have proposed to combine adiabatic compressed air storage (A-CAES) and large scale solid-oxide electrolysis cells (SOEC) for the production of green hydrogen via excess power from wind and solar PV . The system is mainly powered by a solar heliostat system and incorporates compressed air and pumped hydro storage technologies for storing. The basic principle of this technology involves using air compressors to compress air when the demand for electricity is low, and store it in underground caverns or other types of containers. Based on gravity-energy storage, CAES, or a combination of both technologies, David et al. Renewable energy sources such as wind and solar power, despite their many benefits, are inherently intermittent.
