Overview

Studies show that in open containers, most hydrogen dissipates within 1-2 hours. The Hydrogen and Fuel Cell Technologies Office (HFTO) is developing onboard automotive hydrogen storage systems that allow for a driving range of more than 300 miles while meeting cost, safety, and performance requirements. For many years hydrogen has been stored as compressed gas or cryogenic liquid, and transported as such in cylinders, tubes, and cryogenic tanks for use in industry or as propellant in space programs. The overarching challenge is the very low boiling point of H₂: it boils around 20. Quick Answer: Molecular hydrogen in water typically lasts between 20 minutes to 7 days, depending on storage conditions.
