

How much urine can be stored in urinary retention

Overview

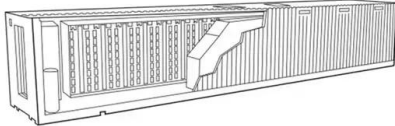

The normal amount of urine retention is typically minimal, with a post-void residual urine volume of less than 50 milliliters considered acceptable. In healthy individuals, the bladder should effectively empty during urination, leaving little to no residual urine. While the bladder can store urine, it is not meant to retain urine after an individual has finished urinating. Urinary retention is the acute or chronic inability to voluntarily pass an adequate amount of urine. What's considered normal—and what might be a sign of a pelvic floor or bladder health issue?

In this blog, the Pelvic Awareness Project explores how much urine a healthy bladder can typically store, what can impact bladder capacity over time, and why paying attention to bladder changes can help you. Immediately after the person urinates, doctors either insert a catheter into the bladder to see how much urine comes out or do ultrasonography of the bladder to measure the.

How much urine can be stored in urinary retention
