

London mechanical energy feedback storage method

Overview

Energy feedback storage acts like a stabilizer, absorbing excess renewable energy during peak production and releasing it when demand spikes. The latest systems in London use: Gravity-based storage in abandoned Tube tunnels (yes, really!). As the UK capital aims for net-zero by 2030, these systems are becoming the unsung heroes of London's green revolution.

DEFINITION: The storage of energy by applying force to an appropriate medium to deliver acceleration, compression, or displacement (against gravity); the process can be reversed to recover the stored kinetic or potential energy. Hence, mechanical energy storage systems can be deployed as a solution to this problem by ensuring that electrical energy is stored during times of high generation and supplied in time of high demand. The rapid growth of intermittent renewable energy in the UK requires flexible and cost-effective electricity storage solutions to support grid stability, prevent curtailment and overall support the decarbonisation targets.
