

# Metro vehicle solar container capacitor failure

## Overview

---

In [22], it was discovered that the electric field distortion brought on by the impact-driven deformation of an MLCC can quickly lead to ceramic capacitor failure. There are several reasons why a capacitor can fail, including:

**Overvoltage:** Exposing a capacitor to a voltage higher than its rated voltage can cause the dielectric material to break down, leading to a short circuit or even a catastrophic failure. This makes capacitors useful in power supply filtering, signal processing, and energy storage applications. The paper clearly distinguishes between capacitor degradation (wear-out) and total failure, and. Therefore, this report explains troubleshooting (diagnosis of failures and appropriate measures) to ensure proper and safe use of capacitors.
