

## Overview

---

The hardware components of a New Energy Vehicle Battery Box include cells, cooling systems, structural enclosures, and electrical connections. The cells—often lithium-ion—are the core energy storage units, arranged in modules to optimize space and performance. It combines the integrated design of the battery pack structure and the chassis to achieve flattening and lengthening of the cell by decreasing the thickness and lengthening the cell. This paper uses the finite element model analysis method of the whole vehicle to verify the mechanical properties of the foamed aluminum material through experiments, and optimizes the design of the. As electric vehicles (EVs) become more prevalent, understanding the core component powering them—the battery box—is essential. An efficient battery housing has many attributes that aid passenger and battery safety and, assist in thermal management, while protecting the battery from the harsh.
