## Overview

---

In this video I show step by step how to build a solar powered sand battery with used panels, the heating element from a water heater and some sand from home depot. The concept of using sand or similar materials to store heat is not entirely new - thermal energy storage has been explored for decades, with systems like molten salt used in concentrated solar power plants since the 1980s. John Klingel's question was simple enough: what's the best way of heating up a thick bed of sand beneath a concrete slab with PEX. One particularly promising innovation is the DIY home sand battery—a simple yet effective system that can store excess energy, especially from renewable sources like solar or wind, for later use. It offers an efficient way to balance the grid and provide heat without fossil fuels.
