

# The prospects of liquid air solar container

## Overview

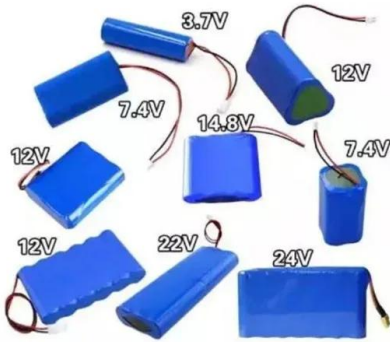

---

After decades of dormancy, the first large-scale storage plant using this technology is set to begin operation in 2026. If successful, it could stand alongside lithium-ion and hydroelectric storage as one of the key pillars of renewable energy, helping reduce global dependence on fossil fuels. New research finds liquid air energy storage could be the lowest-cost option for ensuring a continuous power supply on a future grid dominated by carbon-free but intermittent sources of electricity. MIT PhD candidate Shaylin Cetegen (pictured) and her colleagues, Professor Emeritus Truls Gundersen. While pumped storage hydropower (PSH) and batteries remain the most mature and popular. Pre-fabricated containerized solutions now account for approximately 35% of all new utility-scale storage deployments worldwide. LAES represents a pioneering method that leverages atmospheric power to tackle the challenges associated with energy storage solutions. In the race toward a sustainable energy future, a long-forgotten idea is making a powerful comeback: liquid air batteries.
