

What are the new technologies for high-temperature superconducting solar container

Overview

A research team led by Professor of Physics and Applied Physics Philip Kim has demonstrated a new strategy for making and manipulating a widely studied class of higher-temperature superconductors, called cuprates, clearing a path to engineering new, unusual forms of. This newest generation is especially prized for the high magnetic fields the materials can generate. Enter superconductors, a game-changing (super) solution capable of aligning grid capacity with ambition. As demand from electric vehicles, hydrogen production, and heating and cooling systems accelerates, grids face unprecedented pressure. These materials, which can conduct electricity without resistance at temperatures higher than conventional superconductors, offer transformative possibilities for various technological sectors, particularly in power transmission.
