

What is the working principle of photovoltaic solar container inverter

Overview

The working principle of the inverter is to use the power from a DC Source such as the solar panel and convert it into AC power. This conversion process can be done with the help of a set of IGBTs (Insulated Gate Bipolar. The fundamental problem is simple: solar panels produce direct current (DC) electricity, while your home runs on alternating current (AC). It's like having a key that doesn't fit your lock—the energy is there, but you can't access it. Whether you're installing roof-mounted panels in Austin or constructing an off-grid container system in the rural Kenyan countryside, understanding how an inverter works is crucial to efficiency and safety. Note the many large capacitors (blue cylinders), used to buffer the double line frequency ripple arising due to the single-phase AC system.
