

Wind and solar container in saline aquifers

Overview

Developing large-scale energy storage technologies has been considered as an indispensable approach to mitigating the impacts of grid integration of huge solar and wind energy. Pressed carbon dioxide energy storage in aquifers (CCESA) was recently presented and is capturing. Among the CCUS technologies, CO₂ storage in offshore saline aquifers has gained significant attention in recent years. This paper conducts an in-depth analysis of the Sleipner and Snøhvit projects in Norway and the Tomakomai project in Japan, exploring key issues related to the application. To mitigate dangerous climate change effects, the 195 countries that signed the 2015 Paris Agreement agreed to “keep the increase in average global surface temperature below 2 °C and limit the increase to 1.
